RESEARCH EXPERIENCE

Panoptic NeRF: 3D-to-2D Panoptic Label Transfer

Max Planck Institute for Intelligent Systems

Supervisor: Prof. Andreas Geiger and Prof. Yiyi Liao

Sept. 2021 – Mar. 2022

- Propose Panoptic NeRF, which aims for obtaining per-pixel 2D semantic and instance labels from easy-to-obtain coarse 3D bounding primitives. Our method utilizes NeRF as a differentiable tool to unify coarse 3D annotations and 2D semantic cues transferred from existing datasets. This combination allows for improved geometry guided by semantic information which enables rendering of accurate semantic maps across multiple view. By inferring in 3D space and rendering to 2D labels, our 2D semantic and instance labels are multi-view consistent by design

Faster Solution of Optimization Algorithm with DLDUNN

Zhejiang University

Supervisor: Prof. Guanding Yu

Jun. 2020 – Feb. 2021

- Proposed a novel framework, i.e. a Dual-Layer Deep-Unfolding Neural Network (DLDUNN) which unfolds the iterative Penalty Dual Decomposition (PDD) algorithm into a layer-wise structure whereby some trainable parameters are introduced into the places of the high-complexity operations, e.g. large-dimensional matrix inversions and iterative sub algorithms, so as to address the high computational complexity problem of the dual-layer PDD algorithm and presents the major original performance in the meantime
