RESEARCH EXPERIENCE

Faster Semantic/Instance Labeling with Panoptic NeRF

Max Planck Institute for Intelligent Systems

Supervisor: [Dr. Yiyi Liao](#)

Jul. 2021 – Now

- Propose Panoptic NeRF, which transforms coarse 3D bounding box annotations (static objects in outdoor KITTI360 dataset) into dense and consistent 2D pixel-wise and 3D point-wise semantic and instance annotations
- Panoptic NeRF takes PixelNeRF as the generalized framework and utilizes LiDAR, fisheye, and stereo cameras to improve the output density. With point-wise supervision of 3D bounding boxes, though coarse, Panoptic NeRF can learn 2D priors and overcome the ambiguity of labeling in 3D overlapping areas and generalize semantic and instance annotations in unseen scenes.
- Intend to publish an ECCV 2022 paper as the first author

Faster Solution of Optimization Algorithm with DLDUNN

Zhejiang University

Supervisor: [Prof. Guanding Yu](#)

Jun. 2020 – Feb. 2021

- Proposed a novel framework, i.e. a Dual-Layer Deep-Unfolding Neural Network(DLDUNN) which unfolds the iterative Penalty Dual Decomposition (PDD) algorithm into a layer-wise structure whereby some trainable parameters are introduced into the places of the high-complexity operations, e.g. large-dimensional matrix inversions and iterative sub algorithms, so as to address the high computational complexity problem of the dual-layer PDD algorithm and presents the major original performance in the meantime
- **Laureate of Excellent Award(Team leader) - Student Research Training Program(Province-level)**
